Again and Again!

For the third consecutive year Prismapor-Produtos Electricos Ltd., was awarded for the quality of their performance and risk profile as SMEs EXCELLENCE 2011, this is an initiative of the program FINICRESCE from IAPMEI.

The criteria for the award of distinction is defined in the website of the IAPMEI. However, it is important to note that of a total of about 300000 SMEs, only 1400 obtained this distinction, a rate of 3%.

But above all, nothing is achieved without effort and without of three key factors: CUSTOMERS, STAFF AND SUPPLIERS, these are the success factors for obtaining this classification.

Thanks to all, and here we promise, to continue working towards the next years distinction.

A copy of the award can be seen on the reverse of this letter, or at our website: www.prismapor.pt

Best Regards
A. Pedrosa

N. °35 JANUARY 2012

THE QUERY ABOUT THE STEEL THICKNESS OF THE SWITCHBOARDS

Nowadays shock impact factor (IK), standard IEC 62262 is the determining factor for the rigidity of assemblies instead the formerly specified steel thickness, the rigidity of the panel board and its withstand to external force is in many cases better achieved by molding than by steel thickness reason why nowadays the standard IEC 62262 now include a code to classify the rigidity of the enclosure.

Prismapor as a panel builder from Schneider Electric can offer you panel boards comply with the highest IK code which is IK=10 corresponding to an expected external impact force of 20 joules mechanical energy, which is recommend for some top applications, where maximum risk of impact can damage the switchboards.

Please check in our site www.prismapor.pt PrismaPlus catalogue the "Degree of protection against mechanical impacts IK code "and the recommendation of the risks of impacts (page212).
